Conclusion

About SLS

We wanted to develop an application that would make both of our clients and their housekeepers jobs easier because we discovered via extensive research and data collection that many families struggle with poor communication with their housekeeper.

We got our name SLS from the Arabic word "سلس" which means seamless or in other words is easier or more fluent, which is our goal through this application. Our software contains a number of functions that are primarily concerned with each home worker's daily and weekly tasks being understood.

check list

Clients can create a daily and weekly checklist for their housekeeper to specify tasks. The system will send an alert and notice if a task is completed.

01

Salary tracking

Clients can manage employee contracts, salary deposits, and other elements outlined in their agreement through the salary generator feature.

02

Grocery list

Housekeepers can create a list of missing products, and the system will automatically notify the client. The client can approve or reject the list, and it will be delivered to the driver at the end of each week.

03

911 speed dial

Clients and employees can press this button in emergencies to dial 911. If they do not provide their location in time, the app will automatically send the address to the appropriate authorities three minutes after the call begins.

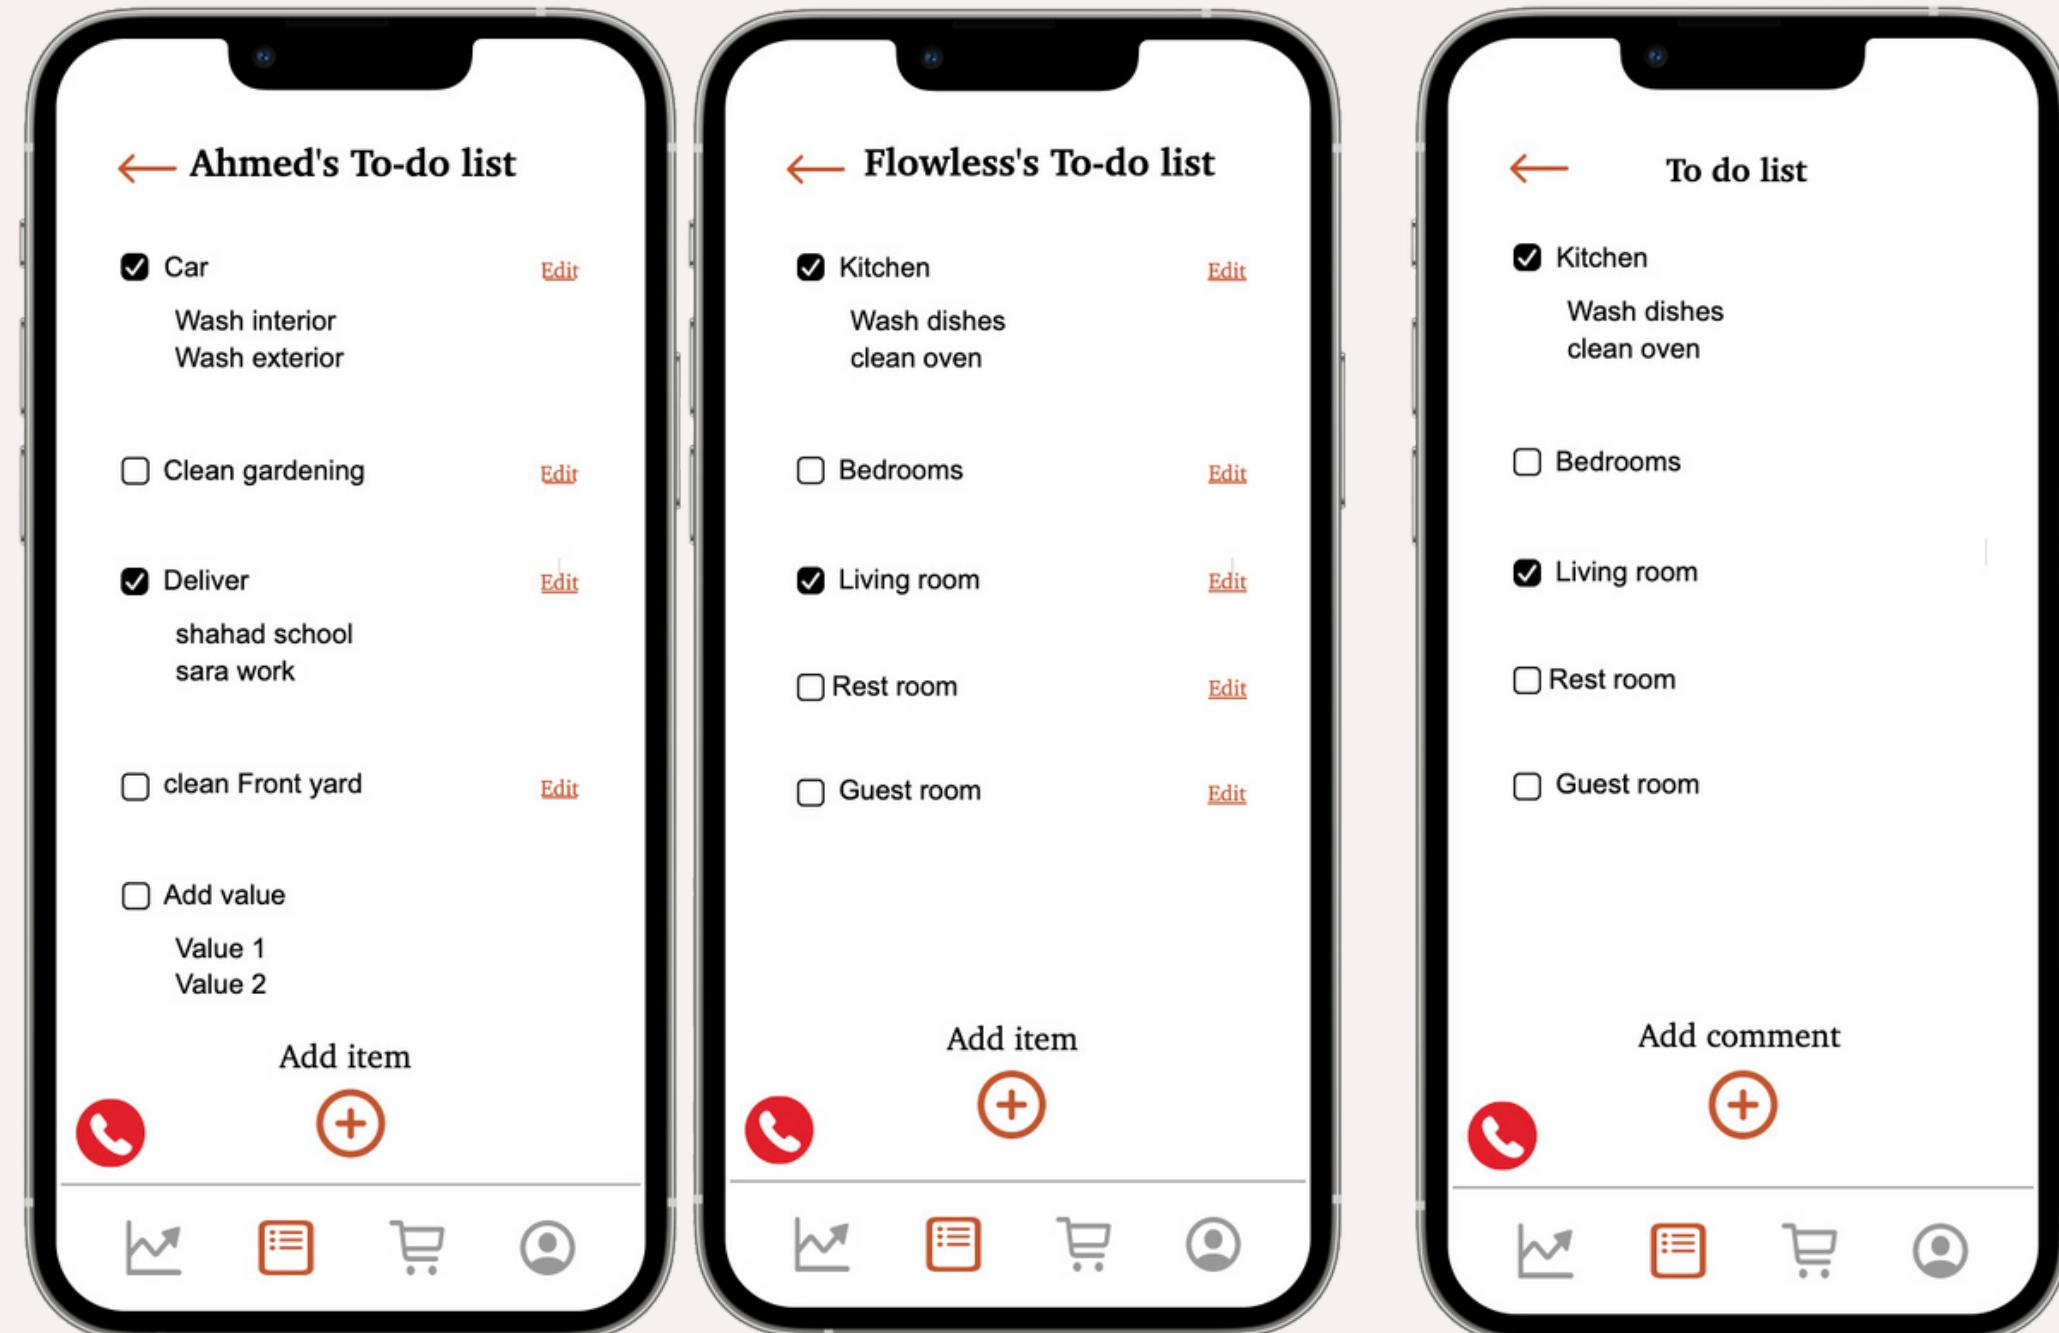

04

SLS Features

check list

Firstly, we have a feature called a check list where each client may make a check list for his or her employee. This list covers daily and weekly chores in detail so that it is clear to the employee what is expected of them and for the client to specify exactly what is required. This feature is also linked to another feature, the salary generator. For instance, if our client creates a clear list of tasks for employees to complete, and they don't, the system will automatically send an alert and a 2-7-day notice, depending on how important the task is. It will then deduct the task from the employee's pay and save the precise date, time, and tasks that weren't completed.

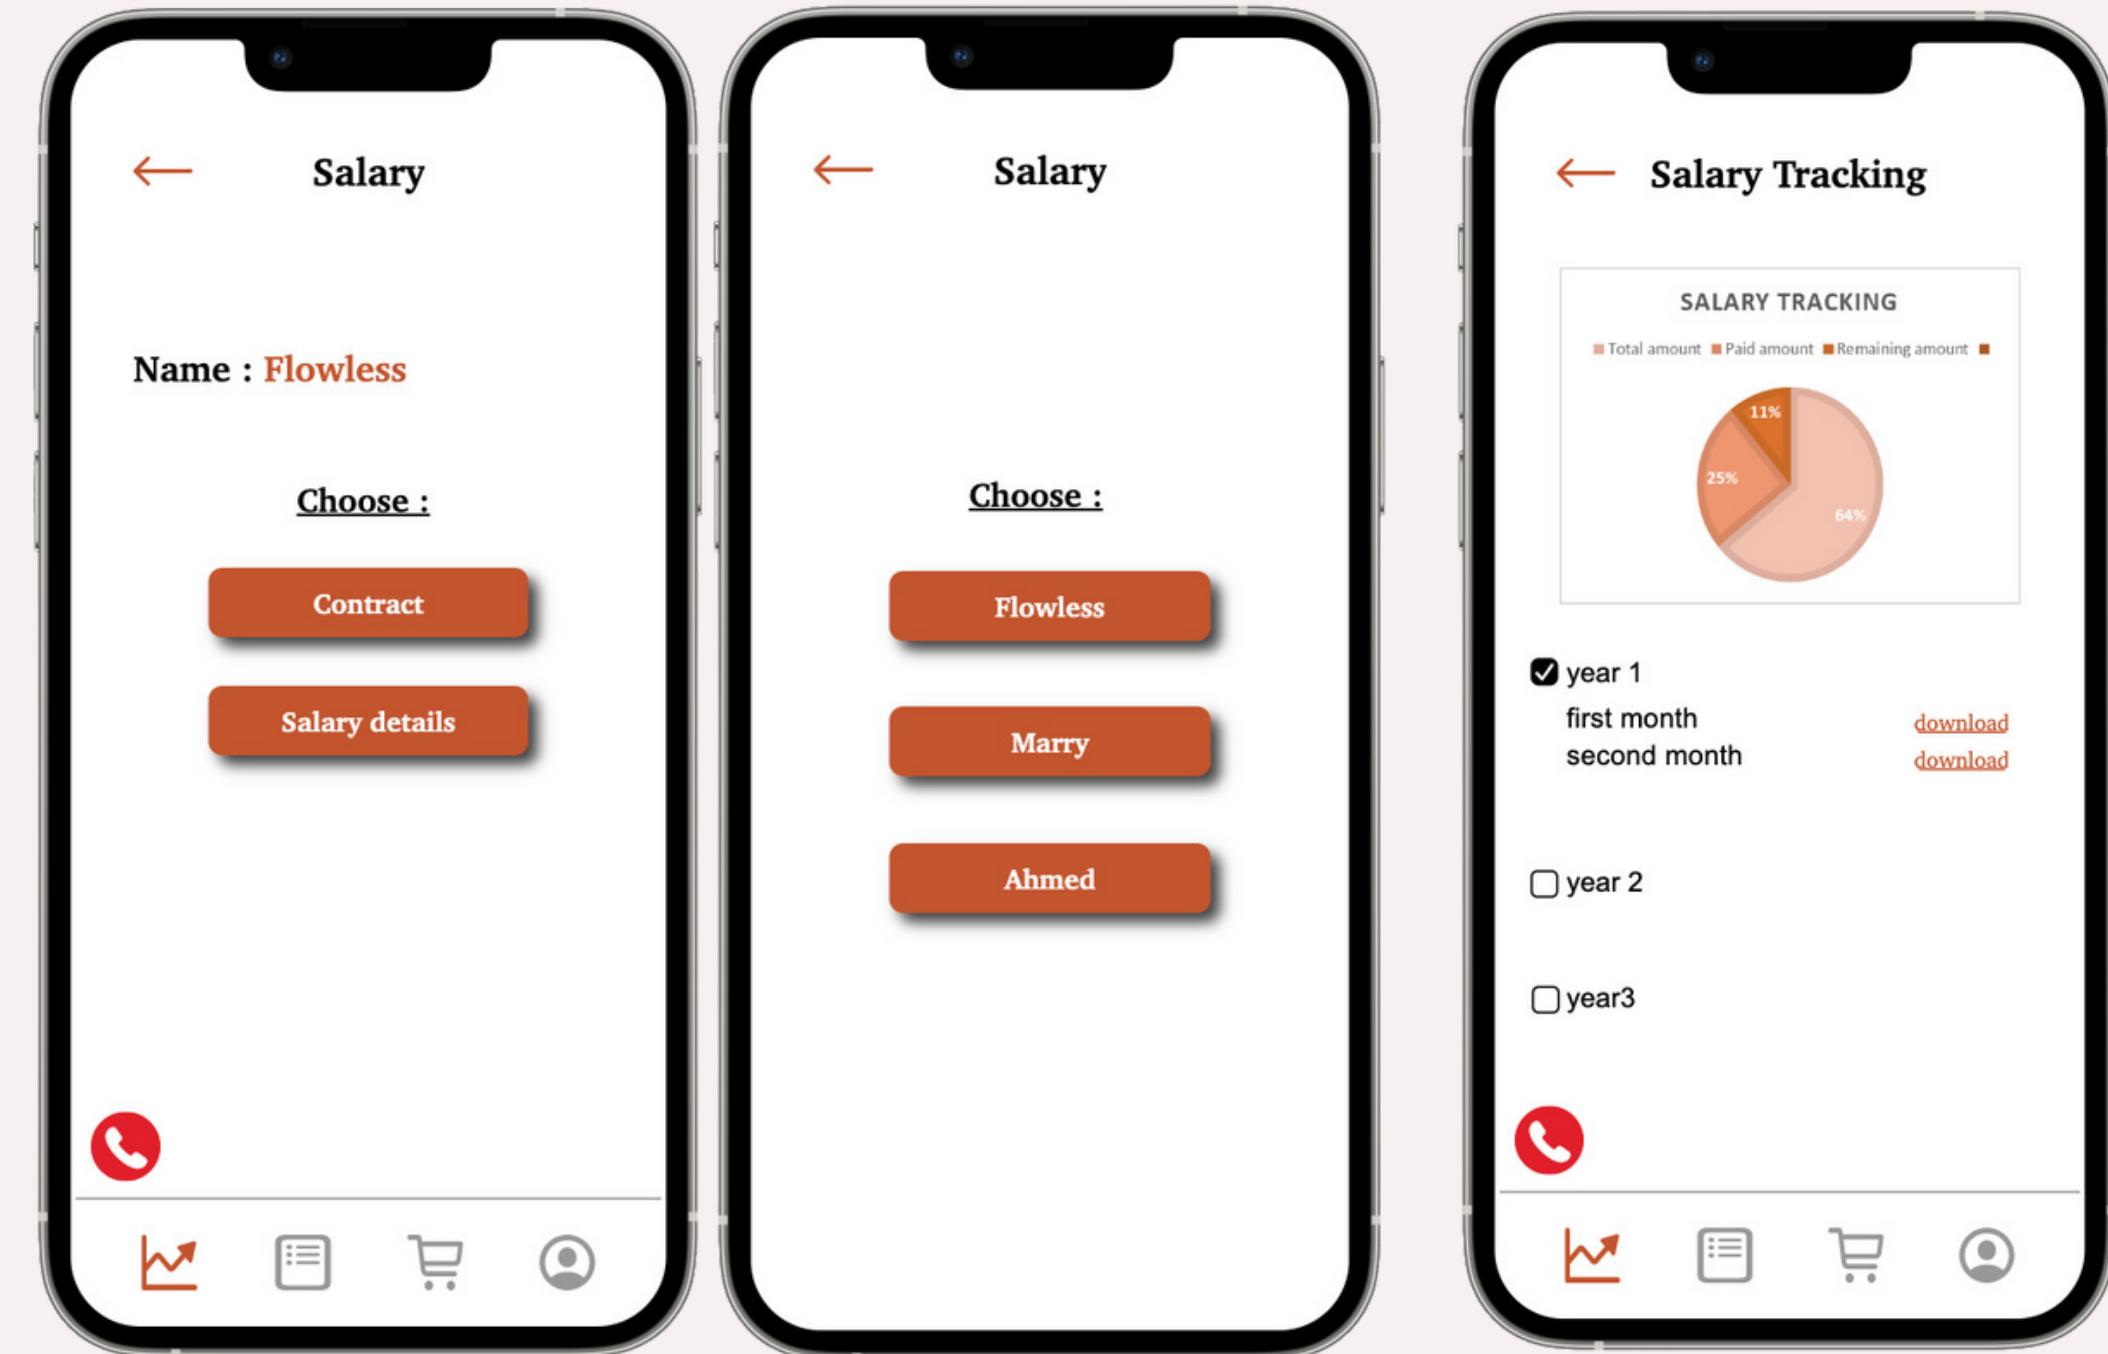

Customer interfaces

Employee interface

Salary tracking

The wage also has many additional components, such as the client's ability to include the contract, salary deposits, employees' signatures on particular items, and many other elements outlined in their agreement. The worker can only read and offer comments or queries; the customer is the only one who can alter this phase.

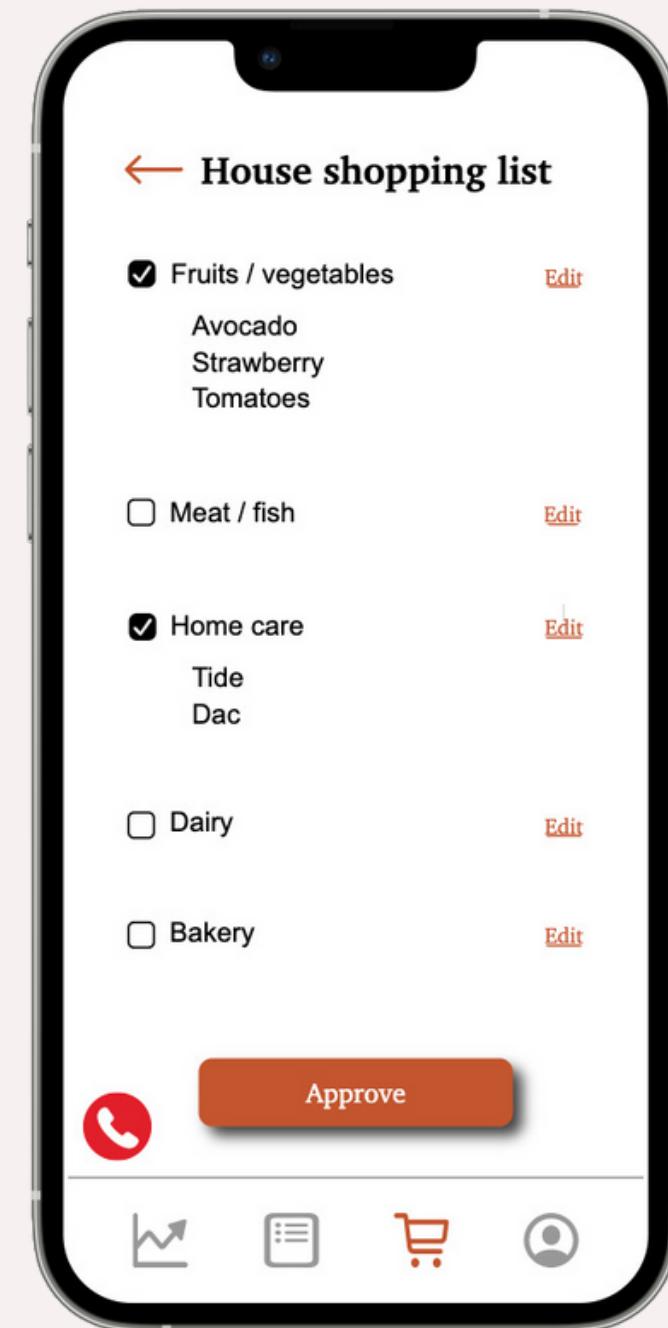

Customer interfaces

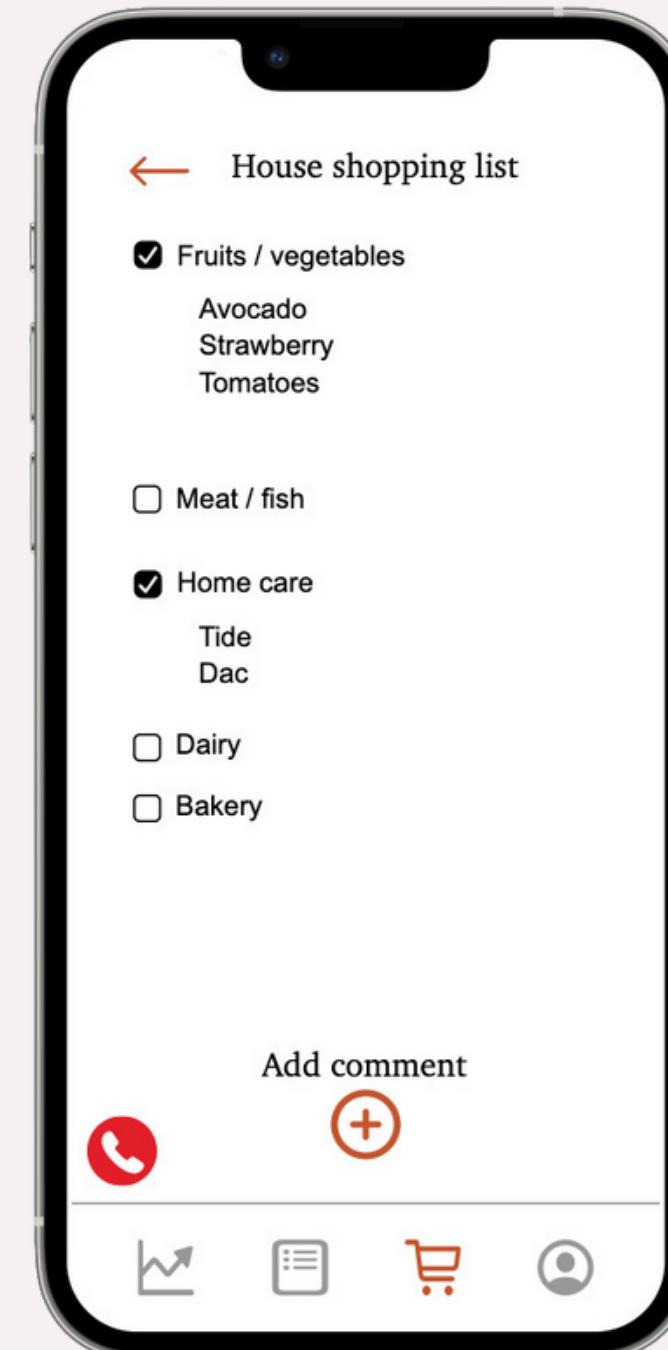

Employee interface

Grocery list

In order to prevent anything from going missing around the house, we get the idea to add grocery lists to our applications while creating check-lists. The housekeeper will create a list of all the products that are needed but are missing, and the system will automatically notify the client about it. The client can then approve or reject the list, which is then delivered effortlessly to the driver at the end of each week.

Customer interface

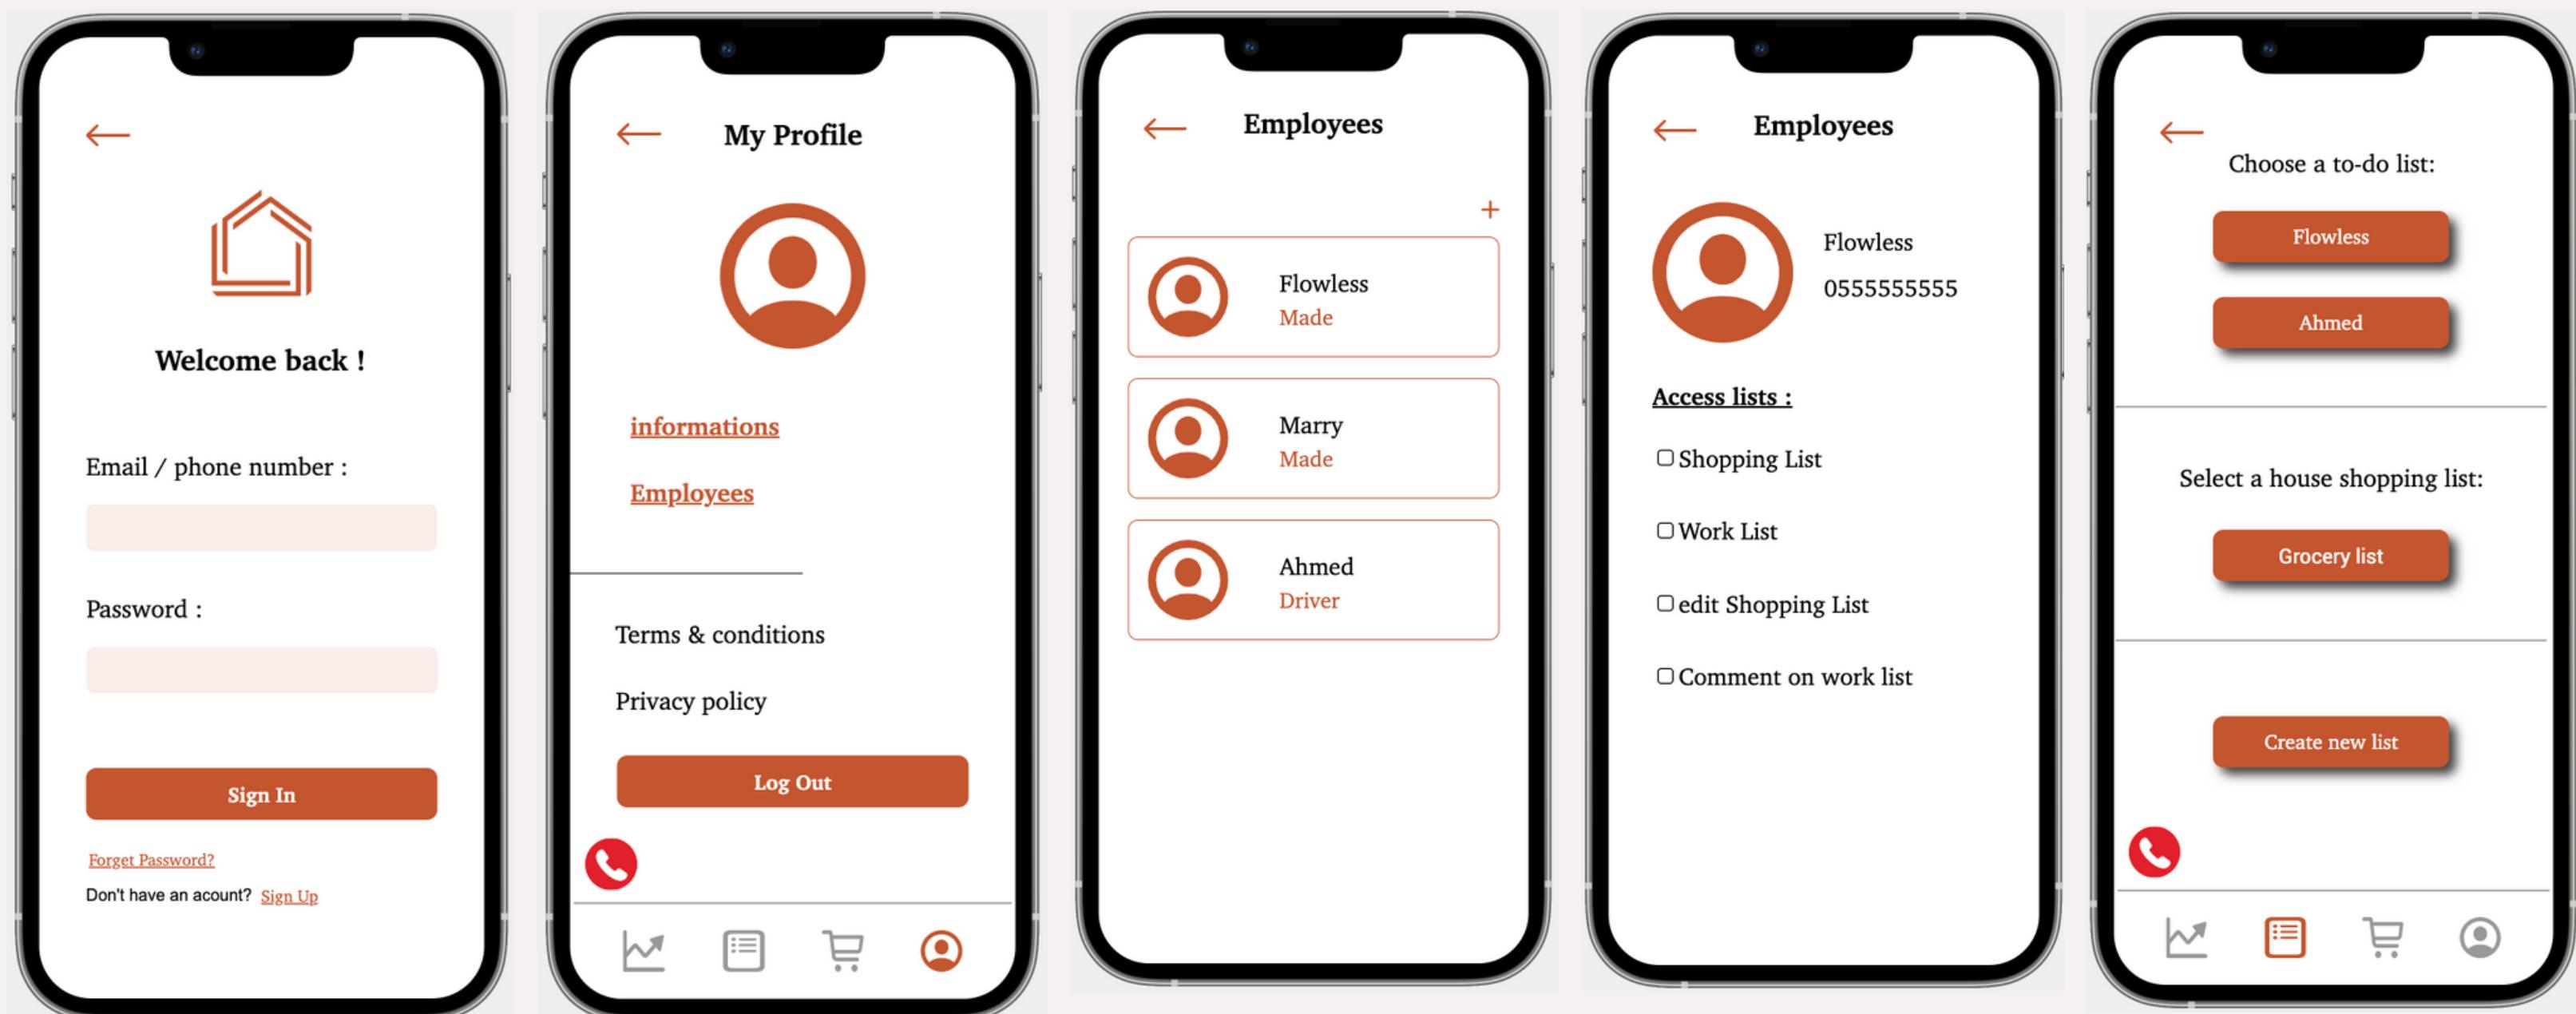

Employee interface

911-speed dial

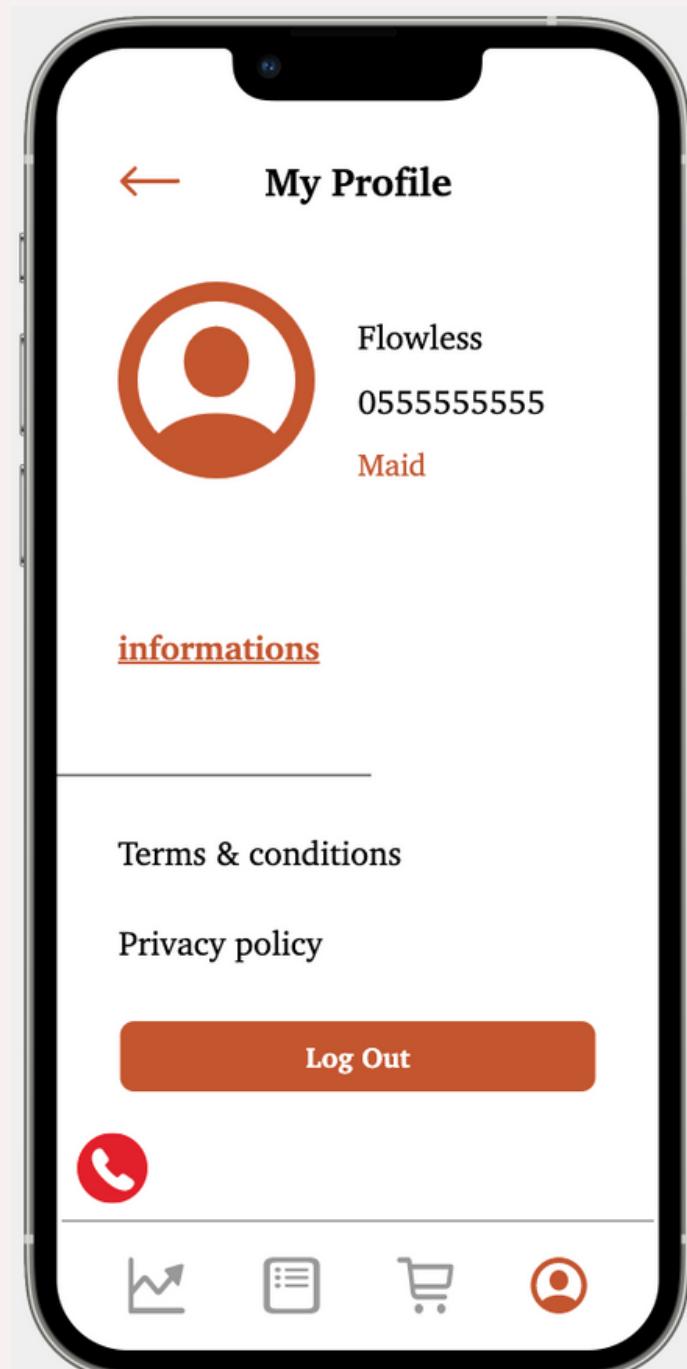

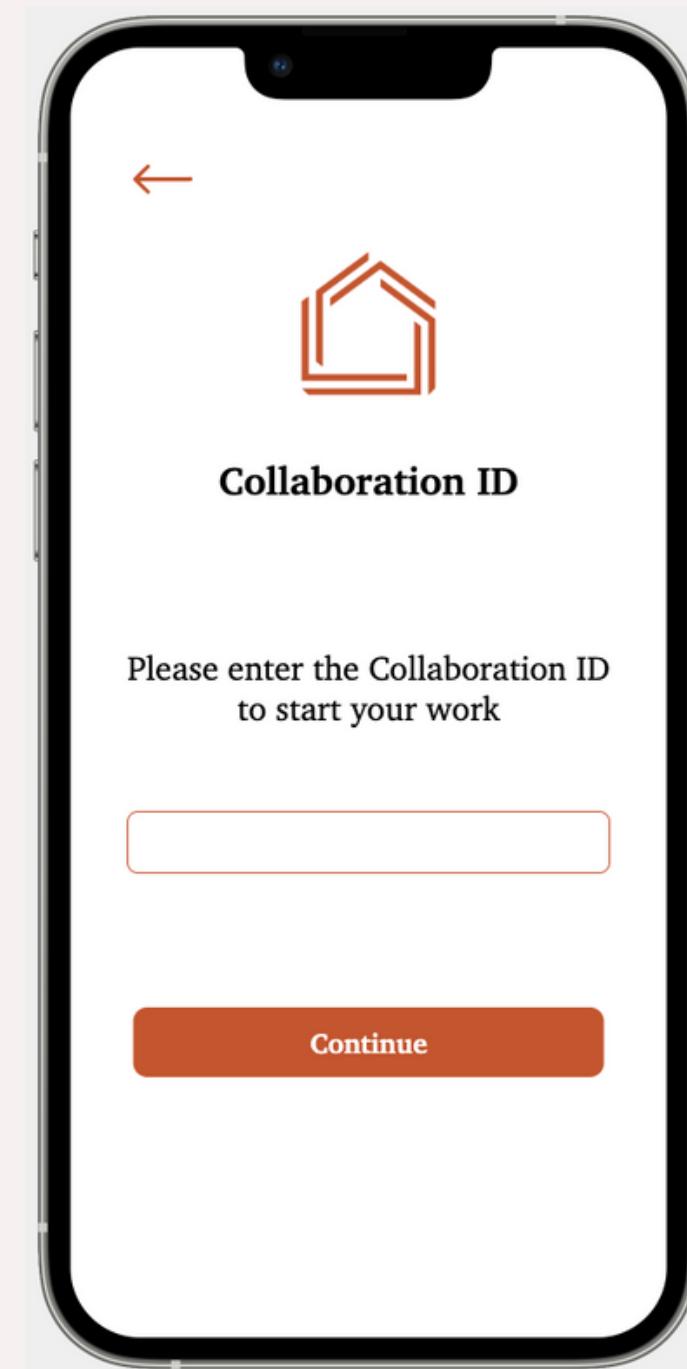

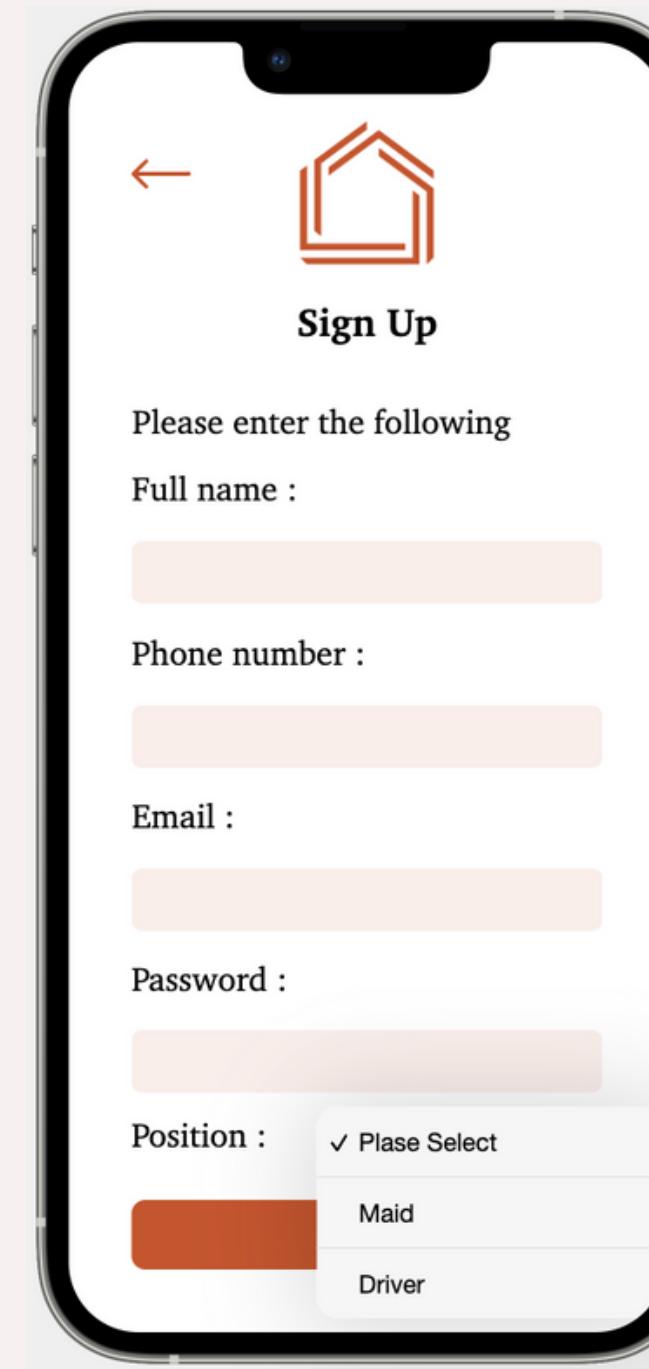

The **911 speed dial button**, which is present on every interface to encourage speed, is the final and, in my opinion, our most crucial safety element. When a client or employee presses this button in an emergency, they can dial 911 to report their issue. If it takes them too long to provide their location, the app is designed to automatically send the address to the appropriate authorities three minutes after the call begins.

Target Audience

Our application platform is designed for both personal and professional use, so the potential target customers or users will be:

- 1. Working parents**
- 2. Team managers**
- 3. Company managers**
- 4. Individuals**

How we arrived to our design

One of the most important goals in our project is the client satisfaction. we want to make sure that the design we made is simple, attractive, and easy to use, so we focused on letting the users express their opinions and suggestions through a published questionnaire, and we searching about similar systems, to help us know our weaknesses to improve and avoid them, while adding other distinctive features. our program did not have exactly same applications, but it was done in the simplest way possible to fulfill the demands of our consumers.

In conclusion,

we hope that our application will make communication simpler and easier for many families, and we intend to make it better in the future by incorporating new features, making it bilingual, and a whole lot more.

Thank You
